

Business Question and Visualization Report

Date	03 October 2026
Team ID	Not provided
Project Name	Food Ordering Behaviour and Consumer Trends
Maximum Marks	5 Marks

Visualization development refers to the process of creating graphical representations of data to facilitate understanding, analysis, and decision-making. The goal is to transform complex datasets into visual formats that are easy to interpret, enabling users to gain insights and make informed decisions. Visualization development involves selecting appropriate visual elements, designing layouts, and using interactive features to enhance the user experience. This process is commonly associated with data visualization tools and platforms, and it plays a crucial role in business intelligence, analytics, and reporting.

Business Questions and Visualisation

The process involves defining specific business questions to guide the creation of meaningful and actionable visualizations in Tableau. Well-framed questions help in identifying key metrics, selecting relevant data, and building visualisation that provide insights.

Project-Specific Business Questions and Visualizations

1. What is the total number of food orders in the dataset?

Visualization: KPI card using COUNT(Order Id).

Observation: Total Orders = 50,000.

Screenshot of visualisation: Insert the corresponding Tableau visual screenshot here.

2. How do cuisine order volumes vary across cities?

Visualization: Heat map using City and Cuisine with COUNT(Order Id).

Observation: The colour intensity changes across city-cuisine combinations, showing variation in order volume.

Screenshot of visualisation: Insert the corresponding Tableau visual screenshot here.

3. How are orders distributed across age groups and restaurant segments?

Visualization: Grouped bar chart using Age Group, Restaurant Type and COUNT(Order Id).

Observation: Gen 2 and Millennial show higher displayed order volumes than Adults and Child, while restaurant segments within groups are relatively close.

Screenshot of visualisation: Insert the corresponding Tableau visual screenshot here.

4. How does order volume vary across cuisine categories?

Visualization: Horizontal bar chart using Cuisine and COUNT(Order Id).

Observation: The displayed cuisine categories have relatively close order volumes, with values around the 8,300–8,450 range.

Screenshot of visualisation: Insert the corresponding Tableau visual screenshot here.

5. How are orders distributed across company type and meal type?

Visualization: Stacked bar chart using Meal Type, Company and COUNT(Order Id).

Observation: Orders are distributed across Alone, Family, Friends and Partner for Breakfast, Dinner, Lunch and Snacks.

Screenshot of visualisation: Insert the corresponding Tableau visual screenshot here.

6. How does average customer rating vary by meal type?

Visualization: Bar chart using Meal Type and AVG(Rating Given).

Observation: Breakfast 3.00954, Dinner 2.99169, Lunch 2.99017 and Snacks 2.98618; all are close to 3.0.

Screenshot of visualisation: Insert the corresponding Tableau visual screenshot here.

7. How is city-wise order volume distributed?

Visualization: Treemap using City and COUNT(Order Id).

Observation: Mumbai 8,443; Pune 8,354; Bangalore 8,353; Delhi 8,309; Chandigarh 8,279; Hyderabad 8,262.

Screenshot of visualisation: Insert the corresponding Tableau visual screenshot here.

8. What percentage of total order value is contributed by each meal type?

Visualization: Pie chart using Meal Type and SUM(Order Value), displayed as percentage of total.

Observation: Breakfast 25.2852%, Snacks 25.0507%, Lunch 25.0307% and Dinner 24.6334%.

Screenshot of visualisation: Insert the corresponding Tableau visual screenshot here.

9. How is the Time Taken To Order measure distributed?

Visualization: Distribution/histogram using Time Taken To Order.

Observation: The visual is used to show the spread and concentration of the time-taken measure across orders.

Screenshot of visualisation: Insert the corresponding Tableau visual screenshot here.
