Maximum Marks	5 Marks

Creating an effective dashboard involves thoughtful design to ensure that the presented information is clear, relevant, and easily understandable for the intended audience. Here are some key principles and best practices for dashboard design

Activity 1: Interactive and visually appealing dashboards

Creating interactive and visually appealing dashboards involves a combination of thoughtful design, effective use of visual elements, and the incorporation of interactive features. Here are some tips to help you design dashboards that are both visually appealing and engaging for users so take care of below points

- Clear and Intuitive Layout
- Use Appropriate Visualizations
- Colour and Theming
- Interactive Filters and Slicers
- Drill-Down Capabilities
- Responsive Design
- Custom Visuals and Icons
- Use of Infographics

Note: Highlight the major outcomes in form of bullet points

Sample:

Here are five potential outcomes from the dashboard image provided:

- **50,000 total orders** were analyzed across multiple cities and food categories.
- **Order volumes are fairly balanced across cities**, with Mumbai and Pune among the higher-volume cities
- **Desserts and Chinese cuisine show strong customer preference** based on order counts
- **Order distribution varies across age groups and restaurant segments**, with Gen Z and Millennials contributing large volumes
- **Meal types have nearly equal revenue contributions and similar average ratings**, showing relatively balanced customer behavior

Activity 2

Publish Dashboard on Tableau Public and Paste the Dashboard Public link below:

Example

Project-Specific Dashboard Design

Dashboard Title: Food Ordering Behaviour and Consumer Trends

The actual dashboard uses a structured 2 × 4 grid with eight visual sections, borders around each section, and legends on the right where required.

Clear and Intuitive Layout

Top row: Flavors Across Cities; Analysis of Orders Across Company Type and Meal Type; Revenue Contribution by Meal Type; Order Distribution by Age Group and Restaurant Segment. Bottom row: Customer Rating Analysis by Meal Type; Cities By Order Value; Total Orders; Distribution of Customer Preferences across Cuisines.

Use Appropriate Visualizations

Heat map for city-cuisine comparison, stacked bars for company and meal type, pie chart for meal-type order value contribution, grouped bars for age group and restaurant segment, bar chart for ratings, treemap for city-wise order volume, KPI for total orders, and horizontal bars for cuisine preferences.

Colour and Theming

Different colours distinguish cities, cuisines, company types, meal types and restaurant types. Legends are displayed where required.

Interactive Filters and Slicers

The current dashboard does not contain separate filter cards or slicers. The visualizations directly present the required categorical comparisons.

Drill-Down Capabilities

No separate drill-down hierarchy has been added. The dashboard focuses on direct comparison of the available dimensions and measures.

Responsive Design

The dashboard is arranged so all eight visuals can be viewed together in a structured layout. Borders and spacing separate the analytical sections.

Custom Visuals and Icons

No external custom icons are used. Standard Tableau visualizations are used for clarity.

Use of Infographics

The Total Orders KPI acts as the main summary indicator, while charts and the treemap provide visual summaries of detailed categories.

Major Outcomes and Observations

- The dashboard analyzes 50,000 total food orders.
- City-wise order volumes are relatively balanced: Mumbai 8,443; Pune 8,354; Bangalore 8,353; Delhi 8,309; Chandigarh 8,279; Hyderabad 8,262.
- The displayed cuisine order volumes are relatively close, with Desserts 8,452, Chinese 8,351 and Biryani 8,300; the remaining categories are also in a similar range.
- The heat map shows that cuisine order volume varies across individual city-cuisine combinations.
- Orders are distributed across Alone, Family, Friends and Partner company types for Breakfast, Dinner, Lunch and Snacks.
- The age-group chart shows higher displayed order volumes for Gen 2 and Millennial than Adults and Child, while restaurant segments within groups are relatively close.
- Average ratings are close to 3.0: Breakfast 3.00954, Dinner 2.99169, Lunch 2.99017 and Snacks 2.98618.
- Meal-type contribution to total Order Value is nearly even: Breakfast 25.2852%, Snacks 25.0507%, Lunch 25.0307% and Dinner 24.6334%.

- Important: the visual titled 'Cities By Order Value' currently uses COUNT(Order Id), so it represents city-wise order volume rather than monetary order value.

Actual Dashboard Used
